

IV Drip Vitamin C

What is Vitamin C?

Vitamin C is essential for healing and plays a profound role in heart and brain functions as well as our immune system. Many factors in our environment today deplete our body's supply of Vitamin C. These include smoking, alcohol, caffeine, air pollutants and the foods that we eat. Vitamin C helps the body recover from inflammation, thrombosis, and restricted blood flow caused by lack of oxygen. Vitamin C IV therapy is helpful when fighting cancer, acute and chronic infections, fatigue, pre and post surgery, and overall boosting the immune system.

Vitamin C Therapy has been known to treat the following conditions:

- Bacterial and viral infections
- Bronchitis
- Cancer
- Common cold
- Decrease heavy metal load prior to and following amalgam removal
- Pneumonia
- Ulcers or wounds
- Upper respiratory infections

Vitamin C also has the ability to neutralize biological toxins in the body through its antioxidant action. Vitamin C is a powerful antiviral agent when taken in larger doses. Vitamin C is also essential in the function of red blood cells, improves the metabolism of the cells and certain vitamins and minerals, encourages cellular healing and repair, and improves energy production.

Vitamin C has also been reported as being useful in the health and continued maintenance of collagen in the skin, connective tissues, capillaries, teeth, and bones.
